

# PIBO Migration Summary

September 1<sup>st</sup> – 10<sup>th</sup>, 2013

*Black-and-white Warbler*

Migration activity was fairly steady from September 1<sup>st</sup> – 10<sup>th</sup> and there were quite a few birds around on the 5<sup>th</sup> and 6<sup>th</sup>. Thrushes were active, with 28 birds captured on the 6<sup>th</sup> – 16 Swainson's, 6 Gray-cheeked, 5 Veerys, and a Wood Thrush – along with 17 warbler species observed on the 5<sup>th</sup>. Ten fall 'firsts' were recorded during the update period.

Strong east winds, rain, and a balmy 22° C on September 1<sup>st</sup> produced a few migrant raptors – Osprey, Merlin, and Bald Eagle – and some thrushes,

flycatchers, and eight warbler species. A few Barn Swallows and Purple Martins continued to move south off the tip. It was warm on the 2<sup>nd</sup> and just three warbler species were observed on the day. There was a slight increase in activity on the 3<sup>rd</sup> and 4<sup>th</sup>, with 47 and 50 species tallied, respectively. More than 100 Canada Geese were recorded on the 3<sup>rd</sup> along with the first Peregrine Falcon of the fall the next day.

Sixty species were tallied on the 5<sup>th</sup> along with the season's first Red-breasted Nuthatches, Blue-headed Vireos, and a Cape May Warbler. A nice variety of 17 warbler species were recorded including 16 American Redstarts, 12 Blackpolls, 11 Magnolias, and three banded Mourning Warblers. Other sightings on the day included five flycatcher, five thrush, and three vireo species. A season-high 11,000 cormorants were observed at the tip. September 6<sup>th</sup> was busy as well, with 52 species counted (15 warbler *spp.*) and 44 individuals captured of thirteen species. A Northern Harrier was new for the fall.

A very quiet morning walk to the tip on the 7<sup>th</sup> – just 16 species were recorded – was made up for with some activity in the netting area where 32 species were observed, including nine warbler species. Interestingly, eight Common Grackles were the only blackbirds tallied throughout six hours of coverage. A similar morning on the 8<sup>th</sup> included a few more Merlins and Sharp-shinned Hawks, nine warbler species, and a handful of Swainson's and Gray-cheeked Thrushes.

More unseasonably warm weather on the 9<sup>th</sup> and 10<sup>th</sup> (23° C at dawn) put a damper on bird activity, with just 38 and 34 species noted over the two days, respectively. Nine warbler species were counted on the 9<sup>th</sup>, including the first Western Palm Warblers of the fall, and eight Bald Eagles were observed at the tip on the 10<sup>th</sup>.

*PIBO's next migration update will be posted on September 22<sup>nd</sup>.*
